

## NUMERICAL PROBLEMS

**P.4.1** A man pushes a lawn mower with a 40 N force directed at an angle of  $20^\circ$  downward from the horizontal. Find the work done by the man as he cuts a strip of grass 20 m long.

**DATA.**  $F = 40 \text{ N}$   
 $\theta = 20^\circ$   
 $d = 20 \text{ m}$

Work done =  $W = ?$

**Sol:** using  $\vec{F} \cdot \vec{d}$ ;  $W = \vec{F} \cdot \vec{d} = Fd \cos \theta$

$$W = 40 \text{ N} \times 20 \text{ m} \times \cos 20^\circ$$

$$= \boxed{7.5 \times 10^2 \text{ J}}$$

$$\therefore \cos 20^\circ = 0.94$$

$$\& \text{ } 1 \text{ N} \cdot \text{m} = 1 \text{ J}$$

**P.4.2** A rain drop ( $m = 3.35 \times 10^{-5} \text{ kg}$ ) falls vertically at a constant speed under the influence of the forces of gravity and friction. In falling through 100 m, how much work is done by (a) gravity and (b) friction.

**DATA.**  $m = 3.35 \times 10^{-5} \text{ kg}$   
 Height =  $h = 100 \text{ m}$

(a) Work done due to gravity = ?

(b) Work done due to friction = ?

**Sol:** We have

Work done due to gravity =  $W = mgh$

$$W = 100 \text{ m} \times 9.8 \text{ m s}^{-2} \times 3.35 \times 10^{-5} \text{ kg}$$

$$= \boxed{0.0328 \text{ J}}$$

Work done due to both gravity and friction is the same. Here, the frictional force is acting on the rain drop against the gravitational force. So

$$\text{Work done by friction} = \boxed{-0.0328 \text{ J}}$$

**P.4.3** Ten bricks, each 6 cm thick and mass 1.5 kg, lie flat on a table. How much work is required to stack them one on the top of another?

**DATA:** Mass of each brick = 1.5 kg = m

Thickness of brick = h = 6 cm = 0.06 m

Work required to stack them one on the top of another = W = ?

**Sol:** There is no work done for the 1st brick. We have to put bricks on it one by one. Therefore, every brick gets some P.E w.r.t its height. so

$$W = 0 + mgh + 2mgh + 3mgh + 4mgh + 5mgh + 6mgh + 7mgh + 8mgh + 9mgh$$

$$W = 45mgh \quad \text{--- (1)}$$

Putting values, we have

$$W = 45 \times 1.5 \text{ kg} \times 9.8 \text{ m s}^{-2} \times 0.06 \text{ m}$$

$$= 39.69 \text{ J} \approx \boxed{40 \text{ J}}$$

**P.4.4** An object of mass 6 kg is travelling at a velocity of  $5 \text{ m s}^{-1}$ . What is its K.E? What will be its K.E if its velocity is double?

**DATA:** Mass of the object = m = 6 kg  
velocity of " = v =  $5 \text{ m s}^{-1}$

(a) K.E = ? (b) K.E = ? (When its velocity is double)

**Sol:** (a) We know that

$$K.E = \frac{1}{2} m v^2$$

$$= \frac{1}{2} \times 6 \text{ kg} \times (5 \text{ m s}^{-1})^2$$

$$= 75 \text{ kg m}^2 \text{ s}^{-2}$$

$$K.E = \boxed{75 \text{ J}}$$

$$\therefore \text{kg m}^2 \text{ s}^{-2} = \text{N}$$

$$\text{N} \times \text{m} = \text{J}$$

(b) Now  $v = 10 \text{ m s}^{-1}$ , therefore

$$K.E = \frac{1}{2} m v^2$$

$$= \frac{1}{2} \times 6 \text{ kg} \times (10 \text{ m s}^{-1})^2$$

$$= 300 \text{ J} = \boxed{3.0 \times 10^2 \text{ J}}$$

**P.4.5** An electron strikes the screen of a cathode-ray tube with a velocity of  $1.0 \times 10^7 \text{ m s}^{-1}$ . Calculate its K.E. The mass of an electron is  $9.1 \times 10^{-31} \text{ kg}$ .

**DATA**. Velocity of electron =  $v = 1.0 \times 10^7 \text{ m s}^{-1}$   
Mass of electron =  $m = 9.1 \times 10^{-31} \text{ kg}$   
K.E = ?

**Sol:** As we know that;

$$\begin{aligned} \text{K.E} &= \frac{1}{2} m v^2 \\ &= \frac{1}{2} \times 9.1 \times 10^{-31} \text{ kg} \times (1.0 \times 10^7 \text{ m s}^{-1})^2 \\ &= 4.6 \times 10^{-17} \text{ kg m}^2 \text{ s}^{-2} \quad (\because 1 \text{ kg m}^2 \text{ s}^{-2} = 1 \text{ J}) \\ \text{K.E} &= \boxed{4.6 \times 10^{-17} \text{ J}} \end{aligned}$$

**P.4.6** If  $100 \text{ m}^3$  of water is pumped from a reservoir into a tank,  $10 \text{ m}$  higher than the reservoir, in 20 minutes. If density of water is  $1000 \text{ kg m}^{-3}$  find

(a) the increase in P.E (b) the power delivered by the pump.

**DATA**. Volume of water =  $V = 100 \text{ m}^3$   
Height =  $h = 10 \text{ m}$

Time taken =  $t = 20 \text{ min} = 20 \times 60 \text{ s} = 1200 \text{ s}$

Density of water =  $\rho = 1000 \text{ kg m}^{-3}$ .

(a) Increase in P.E = ?

(b) Power delivered by the Pump =  $P = ?$

**Sol.** (a) As Density ( $\rho$ ) =  $\frac{\text{Mass (m)}}{\text{Volume (V)}}$

$$\therefore m = V \times \rho \quad \text{--- (1)}$$

$$= 100 \text{ m}^3 \times 1000 \text{ kg m}^{-3}$$

$$m = 10^5 \text{ kg} \quad \text{--- (2)}$$

Also

Work done = P.E =  $mgh$

$$= 10^5 \text{ kg} \times 9.8 \text{ m s}^{-2} \times 10 \text{ m}$$

$$\text{Increase in P.E} = \boxed{9.8 \times 10^6 \text{ J}} \quad \text{--- (3)}$$

(b) Now Power ( $P$ ) =  $\frac{\text{Work (W)}}{\text{time (t)}}$

$\therefore$

$$P = \frac{9.8 \times 10^6 \text{ J}}{1200 \text{ s}} = 8166.6 \text{ watt}$$

$$P = 8.167 \times 10^3 \text{ watt} \approx \boxed{8.2 \text{ kW}}$$

**P.4.7** A force (thrust) of 400 N is required to overcome road friction and air resistance in propelling an automobile at  $80 \text{ km h}^{-1}$ . What power (KW) must the engine develop?

**DATA.**  $F = 400 \text{ N}$

$$\text{Velocity} = v = 80 \text{ km h}^{-1} = \frac{80 \times 1000}{60 \times 60} = 22.22 \text{ m s}^{-1}$$

$$\text{Power} = P (\text{in KW}) = ?$$

**Sol:** As  $P = \vec{F} \cdot \vec{v} = Fv \cos 0^\circ = Fv$  ( $\because$  Force & vel are along the same direction)

$$P = 400 \text{ N} \times 22.22 \text{ m s}^{-1}$$

$$P = 8888 \text{ watt}$$

$$= 8.9 \times 10^3 \text{ K.Watt} = \boxed{8.9 \text{ KW}}$$

**P.4.8** How large a force is required to accelerate an electron ( $m = 9.1 \times 10^{-31} \text{ kg}$ ) from rest to a speed of  $2 \times 10^7 \text{ m s}^{-1}$  through a distance of 5 cm?

**DATA.** Mass of electron =  $m = 9.1 \times 10^{-31} \text{ kg}$

$$\text{Initial velocity} = v_i = 0$$

$$\text{Final} \quad \quad \quad = v_f = 2 \times 10^7 \text{ m s}^{-1}$$

$$\text{Distance} = d = 5 \text{ cm} = 0.05 \text{ m}$$

$$\text{Force required} = F = ?$$

**Sol:** Using work-energy principle;

$$F \times d = \frac{1}{2} m v_f^2 - \frac{1}{2} m v_i^2$$

Putting the values, we have;

$$F \times 0.05 \text{ m} = \frac{1}{2} \times 9.1 \times 10^{-31} \text{ kg} \times (2 \times 10^7 \text{ m s}^{-1})^2 - 0$$

$$F = 3.6 \times 10^{-15} \text{ kg m s}^{-2} =$$

$$\therefore F = \boxed{3.6 \times 10^{-15} \text{ N}}$$

**P.4.9** A diver weighing 750 N drops from a board 10 m above the surface of a pool of water. Use the conservation of mechanical energy to find his speed at a point 5 m above the water surface, neglecting air friction?

**DATA.** Weight of diver =  $W = 750 \text{ N}$

$$h_1 = 10 \text{ m}$$

$$h_2 = 5 \text{ m}$$

Speed of diver =  $V = ?$

**Sol.** As we know;

Loss of P.E = Gain in K.E

$$m'g(h_1 - h_2) = \frac{1}{2} \times m'v^2$$

$$v^2 = 2g(h_1 - h_2)$$

$$v = \sqrt{2g(h_1 - h_2)} \quad \text{--- (1)}$$

Putting values, we have;

$$v = \sqrt{2 \times 9.8 \text{ m s}^{-2} \times (10 \text{ m} - 5 \text{ m})}$$

$$v = \boxed{9.9 \text{ m s}^{-1}} \quad \text{--- (2)}$$

**P.4.10** A child starts from rest at the top of a slide of height  $4 \text{ m}$  (a) What is his speed at the bottom if the slide is frictionless? (b) if he reaches the bottom with a speed of  $6 \text{ m s}^{-1}$ , what percentage of his total energy at the top of the slide is lost as a result of friction?

**DATA.** Height of slide =  $h = 4 \text{ m}$

(a) speed at the bottom =  $V = ?$

(b) % age of total energy lost = ? (if  $V' = 6 \text{ m s}^{-1}$ )

**Sol:** (a) As Loss of P.E = Gain in K.E

$$mgh = \frac{1}{2} \times mv^2$$

$$v^2 = \sqrt{2gh} = \sqrt{2 \times 9.8 \text{ m s}^{-2} \times 4 \text{ m}}$$

$$v = \boxed{8.8 \text{ m s}^{-1}} \quad \text{--- (1)}$$

(b) Loss of energy = K.E - K.E'

$$= \frac{1}{2} \times mv^2 - \frac{1}{2} \times mV'^2$$

$$= \frac{1}{2} \times m \times (8.8)^2 - \frac{1}{2} \times m (6)^2$$

$$= (38.72 \text{ m} - 18 \text{ m}) \text{ J} \quad \text{--- (2)}$$

$$= (20.72 \text{ m}) \text{ J} \quad \text{--- (3)}$$

$$\% \text{ Loss of energy} = \frac{20.72 \text{ m}}{38.72 \text{ m}} \times \frac{100}{100}$$

$$= \boxed{54\%}$$
